The specification describes a method for producing an extracellular matrix protein or its fragment. The extracellular matrix protein is capable of self aggregating in a cell which does not ordinarily hydroxylated prolines. The method comprises optimising a nucleic acid sequence for expression in the cell by substitution of codons preferred by that cell for naturally occurring codons not preferred by the cell; in corporating the nucleic acid sequence into the cell; and contacting the cell with a hypertonic growth medium containing at least one amino acid, selected from the group consisting of trans-4-hydroxyproline and 3-chydroxyproline to allow at least one of the amino acids to be assimilated into the cell and incorporated into the extracellular matrix protein. The method may be used to make host cells assimilate and incorporate trans-4-hydroxyproline into proteins. This is especially useful in the recombinant production of proteins such as collagen, fibrinogen and fibronectin whose ability to self aggregate and produce functional proteins depends on the post translational hydroxyproline. The method is also useful in studying the structure and function of proteins expensents shown as collagen. (alphal) helical region, chieful and contains dependence represents human collagen; captain and produce function of presents expense the sequence in the contains trans-4-hydroxyproline. The contains dependence represents human collagen; captain in studying the structure and function of presents expensents human collagen; captain in the contains dependence represents human collagen; captain in the contains dependence represents and produce function of presents expensed the contains dependence represents and captains in the contains dependence represents the sequence in the contains the contains dependence represents and captains in the contains dependence represents and captains in the contains the contains dependence represents the contains the contains dependence represents the contains the contains the contains the con
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     260

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ò
```

Extracellular matrix protein; self aggregation; hydroxylated proline; trans-4-hydroxyproline; 3-hydroxyproline; recombinant protein production; collagen; fibrinogen; fibronectin; post translational hydroxylation.

Homo sapiens

A human collagen 1 (alpha1) protein helical region.

(first entry)

25-JUL-2000

Æ

AAY84544 standard; protein; 1057

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence represents a human type 1 (alphal) collagen protein. Peptides derived from the protien were used to demonstrate incorporation of 3,4-dehydro---prolline into the peptide, using the method of the invention. The specification describes a method for the incorporation of non-natural amino acid into a polypeptide. The method comprises reacting at least one 3,4-dehydroprolline residue in the polypeptide with an epoxyprolline residue. The method is used for studying the effects of non-natural amino acids on structure and function of polypeptides. The method is also wiseful for commercial production of collagen or mussel adhesive proteins (which are useful as bloadbesives), and for incorporating a wide variety of groups, including therapeutic ligands and biological probes,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   9
                                                                                                                                                                                                                                                                                                   A fusion protein (AAR89472) comprises the alpha-helical region of human collagen I(a) linked to amino acids 46-93 of human mature dermatan sulphate proteoglycan (decorin). It can be expressed in Escherichia collaransformants carrying a vector incorporating a chimeric gene (AAR16518) coding for the fusion. The decorin binds to type I collagen and thus affects Elbril formation. It inhibits the cell attachment-promoting activity of collagen and fibrinogen by binding to such molecules near their cell binding sites. The collagen moiety provides an integral substratum or scaffolding for the decorin. The fusion protein acts to reduce scarring of healing tissue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      1 GSEGPEGVRGEPGPPGPAGAAGPAGDPGADGEPGAKGADGAPGIAGAPGFPGARGPSGPE

The specification describes a method for producing an extracellular matrix protein is matrix protein or its fragment. The extracellular matrix protein is capable of self aggregating in a cell which does not ordinarily hydroxylated prolines. The method comprises optimising a nucleic acid sequence for expression in the cell by substitution of codons preferred by that cell for naturally occurring codons not preferred by the cell; incorporating the nucleic acid sequence into the cell; and contacting the incorporating the nucleic growth medium containing at least one amino acid, selected from the group consisting of trans-4-hydroxyproline and 3-hydroxyproline to allow at least one of the amino acids to be assimilated into the cell and incorporated into the extracellular matrix protein. The method may be used to make host cells assimilate and incorporate trans-4-hydroxyproline into proteins. This is especially useful in the hydroxyproline into proteins such as collagen, fibrinosgen and fibronectin whose ability to self aggregate and produce functional contains depends on the post translational hydroxylation of proline. The

This invention relates to novel nucleic acids and proteins present in normal and neoplastic pancratic calls, pancratic cancer is a common cause of cancer death worldwide, therefore accurate methods of diagnosis and treatment are required. Compounds which modulate the proteins of the invention may have cytostatic activity and the protein and DNA sequences of the invention may be useful for the development of a vaccine or in gene therapy. The composition and methods are useful in diagnosing, staging, inaging, monitoring, preventing or treating pancreatic cancer and non-cancerous disease states of the pancreas. The present sequence is that of a human pancreatic protein of the invention.
                                                                                                                                                                                                                                                                                                                                                 ö

It can be expressed in Escherichia coll transformants carrying a vector incorporating a chimeric gene (AAT16515) coding for the fusion. The BMP moiety induces osteogenesis, while the collagen moiety provides an integral substratum or scaffolding for the BMP and cells involved in reconstruction and growth. The fusion protein provides sustained release and delivery of BMP to a target tissue

Chimaeric DNA encoding protein contg. extracellular matrix protein doma - and cellular regulatory factor domain, partic. useful as osteogenic agents, also related vectors, transformed cells and chimaeric proteins.

Disclosure; Fig 6; 59pp; English

A fusion protein (AAR89470) comprises the alpha-helical region of human collagen I(a) linked to the human mature transforming growth factor beta-(iTGF-beta-1). It can be expressed in Escherichia coli transformants carrying a vector incorporating a chimeric gene (AAT16516) coding for the fusion. The TGF-beta-motety increases efficacy of the body's normal soft tissue repair response and also induces osteogenesis. The collagen moiety provides an integral substratum or scaffolding for the TGF and cells involved in reconstruction and growth. The fusion protein provides sustained release and delivery of TGF-beta-1 to a target tissue

capable of self aggregating in a cell which does not ordinarily capable of self aggregating in a cell which does not ordinarily capable of self aggregating in a cell which does not ordinarily capable of sequence for expression in the cell by substitution of codons preferred by that cell for naturally occurring codons not preferred by the cell; incorporating the nucleic acid sequence into the cell; and contacting the cell with a hypertonic growth medium containing at least one amino acid, selected from the group consisting of trans-4-hydroxyproline and 3-chydroxyproline to allow at least one of the amino acids to be assimilated into the cell and incorporated into the extracellular matrix protein. The method may be used to make host cells assimilate and incorporate trans-4-hydroxyproline into proteins. This is especially useful in the recombinant production of proteins such as collagen, fibrinogen and fibronectin whose ability to self aggregate and produce functional corputation also useful in studying the structure and function of proteins expensents enthemory that explained the produced using the prowth factor-betal (TGF-betal) protein, which may be produced using the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  260
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This invention relates to novel nucleic acids and proteins present in normal and neoplastic pancreatic cells. Pancreatic cancer is a common cause of cancer death worldwide, therefore accurate methods of diagnosis and treatment are required. Compounds which modulate the proteins of the invention may have cytostatic activity and the protein and DNA sequences of the invention may be useful for the development of a vaccine or in gene therapy. The composition and methods are useful in diagnosing, staging, imaging, monitoring, preventing or treating pancreatic cancer and non-cancerous disease states of the pancreas. The present sequence is that of a human pancreatic protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New pancreatic specific nucleic acid molecule or protein for diagnosing, staging, imaging, monitoring, preventing or treating pancreatic cancer onn-cancerous disease states of the pancreas.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           240
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This invention relates to novel nucleic acids and proteins present in normal and neoplastic pancreatic calls. Pancreatic cancer is a common cause of cancer death worldwide, therefore accurate methods of diagnosis and treatment are required. Compounds which modulate the proteins of the invention may have cytostatic activity and the protein and DNA sequences of the invention may be useful for the development of a vaccine or in gene therapy. The composition and methods are useful in diagnosing, anothering, preventing or treating pancreatic cancer and non-cancerous disease states of the pancreas. The present sequence is that of a human pancreatic protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          300
                                                                                                                                                                                                                                                                                                                                                                                                                                                               New pancreatic specific nucleic acid molecule or protein for diagnosing, staging, imaging, monitoring, preventing or treating pancreatic cancer or non-cancercus disease states of the pancreas.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               GPPGERGGPGSRGFPGADGVAGPKGPAGERGSPGPAGPKGSPGEAGRPGEAGLPGAKGLT 180

A fusion protein (AAR89471) comprises the alpha-helical region of human collagen I(a) linked to human dermatan sulphate proteoglycan (decorin). It can be expressed in Escherichia coli transformante carrying a vector incorporating a chimeric gene (AAT16517) coding for the fusion. The decorin binds to type I collagen and thus affects Elbril formation. It inhibits the cell attachment-promoting activity of collagen and this fibrinogen by binding to such molecules near their cell binding sites. The collagen moiety provides an integral substratum or scaffolding for the decorin. The fusion protein acts to reduce scarring of healing tissue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              441 GPPGAVGPAGKDGEAGAQGPPGPAGPAGPAGBRGBQGPAGSPGFPGGLPGPAGPPGEAGKPGEQ 500

The method comprises: (a) culturing a recombinant host cell comprising a constant of a fibrillar collagen monomer lacking a C propertide SSAD (sequence selection and alignment domain); and (b) producing the fibrillar collagen. The methods are used to produce fibrillar collagen, comprising DNA encoding a collagen fibrils can be derived. Host cells, comprising DNA encoding a collagen monomer lacking SSAD or N propeptide is used to produce gelatin. Collagen is used in biological research as a substrate for in vitro cell culture and as a component of biocompatible matrices, artificial skin and wound dressing and healing devices. Gelatin is particularly useful for foodstuffs and medicine, for coating tablets and making capsules. The methods, comprising the use of collagen monomers lacking the N and/or C propeptides, result in a large increase in the production of type I collagen. He present sequence represents the human preproalpha I (I) collagen (GenBank Accn no: AP017178)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ò

Stimulating or inhibiting cell growth and/or division, useful for
stimulating chondrogenesis, cartilage, disc or connective tissue growth,
repair, and/or regeneration, comprises administering deer antler
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention discloses a method for stimulating or inhibiting cell growth and/or division which comprises contacting or inserting into an animal cell a polypeptide comprising one of the deer antler cartilage
                                                                                                                                                                                                                                                                                                                                                                                                    Human, deer, rat, mouse, DACC, deer antler cartilage cell; cell stimulation; cell inhibition; cell growth; cell division; mesenchymal cell; chondrocyte; chondrogenesis; osteogenesis; growth; repair; regeneration; restoration; extracellular matrix; cartilaginous matrix; cartilaginous matrix; cartilage; disc; connective tissue; agonist; antagonist; gene therapy.
                                                                                                                                                                                                                                                                                                                 Human polypeptide orthologous to DACC-11.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Claim 13; Page 154-160; 214pp; English.
ABG93947 standard; protein; 1461 AA

٠,

cert Unactor formers assertable and characterity, the method relates to these polypeptides capable of stimulating chondrogenesis, the genes of these polypeptides capable of stimulating chondrogenesis, the genes of these polypeptides capable of stimulating chondrogenesis, osteogenesis, growth, repair, regeneration and/or restoration of the extracellular matrix. The DACC polypeptides and polymocleotides are useful for identifying an agent that modulates the activity of the polypeptide, for stimulating mesenchymal cell growth and/or division by exposing animal mesenchymal cell growth and/or division by exposing animal mesenchymal cell growth and/or division by exposing animal mesenchymal cells to conditioned media or its active fraction, obtained from deer antler cartilage cells, for inhibiting cell growth and/or division by inserting into an animal cell, a compound which inhibits the translation of the polypucleotide encoding the DACC. The method and the polypeptides are useful for stimulating mesenchymal cell growth and/or division or for stimulating chondrogenesis, cartilage, disc or connective tissue growth, repair, regeneration and/or restoration in growth and/or division or for stimulating chondrogenesis, cartilage, disc or connective tissue growth, repair, regeneration and/or restoration in glowthead in treatment modalities, specifically in gene therapy. The polypoptides can be used as bait proteins in a two- or three-hybrid assay to polypeptide and are involved in modulating cell growth and/or division. The sequences presented in ABG99923-ABG9948 are the proteins encoded by the DACC cDNA clones ô 538 420 598 GPGGPPGPKGDSGEPGAPGSKGDTGAKGEPGPVGVEGPPGPPGBEGKPGARGEPGPTGLP 120 419 GPGGPPGPKGNSGEPGAPGSKGDTGAKGEPGPVGVQGPPGPAGEBGKRGARGEPGPTGLP 478 121 GPPGERGGPGSRGFPGADGVAGPKGPAGERGSPGPAGPKGSPGEAGRPGEAGLPGAKGLT 180 GSPGSPGPDGKTGPPGPAGEDGRPGPPGPRGARGEAGVMGFPGPKGAAGEPGKAGERGVP 240 GPPGAVGPAGKDGEAGAEGPPGPAGPAGERGEEGPAGSPGFEGLPGPAGPPGEAGKPGEE 300 GPPGAVGPAGKDGEAGAQGPPGPAGPAGERGEQGPAGSPGFQGLPGPAGPPGEAGKPGEQ 658 GVPGDLGAPGPSGARGEPGFPGERGVEGPPGPAGPPGADGAPGDDGAKGDAGAPGAPGSE 360 GVPGDLGAPGPSGARGERGFPGERGVQGPPGPAGPRGANGAPGNDGAKGDAGAPGAPGSQ 718 1 GSEGPEGVRGEPGPPGPAGAAGPAGDPGADGEPGAKGADGAPGIAGAPGFPGARGPSGPE 60 GSPGSPGFDGKTGPPGPAGQDGRPGPPGPRGQARGQAGVMGFPGPKGAAGEPGKAGERGVP 361 GAPGLEGMPGERGAAGLPGPKGDRGDAGPKGADGSPGKDGVRGLTGPIGPPGPAGAPGDK Gaps 96.6%; Score 2966; DB 5; Length 1461; 95.6%; Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 9, Ap

Sequence 20, Application US/08963825;
Patent No. 6110689;
GENERAL INFORMATION:
APPLICANT: QVist, Per
APPLICANT: Bonde, Martin
TITLE OF INVENTION: A Method for Assaying Collagen Fragments
TITLE OF INVENTION: in Body Fluids, A Test Kit and Means for Carrying Out t
TITLE OF INVENTION: Method and Use of the Method to Diagnose the Presence of
TITLE OF INVENTION: Disorders Associated with the Metabolism of

Sequence 20, Application US/09570573

Sequence 20, Application US/09570573

Patent No. 6342361

GENERAL INFORMATION:
APPLICANT: Qvist, Per
APPLICANT: Qvist, Per
TITLE OF INVENTION: A Method for Assaying Collagen Fragments
TITLE OF INVENTION: in Body Fluids, A Test Kit and Means for Carrying Out ITLE OF INVENTION: in Body Fluids, A Test Kit and Means for Carrying Out ITLE OF INVENTION: Disorders Associated with the Metabolism of NUMBER OF SEQUENCES: 21

CORRESPONDENCE ADDRESS:
ADDRESSEB: Darby & Darby PC
                                                                                                                                                                                                                                                   o,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                420
